

## Elephant Grass

What is elephant grass?

- Elephant grass is a species of perennial tropical grass. The grass is native to the African grasslands. The grass has low water and nutrient requirements. With little requirement needed the grass can be placed in undeveloped areas.

Why is it important?

- Elephant grass is able to add vegetation to areas that lack the typical nutrition which is needed for plants. The elephant grass is a great source of shelter for animals. The grass can also be planted around a cornfield to protect the field from animals who like to eat the corn.

Where is the grass found?

- Along lake beds
- Near rivers
- Around fields of plants
- Africa
