

## Rain Garden With Native Species

What is a Rain Garden?

- A rain garden is a sunken area in the environment that collects rainwater from a roof, driveway, or street. This area allows for the water to soak back into the ground. These gardens are created with plants that are native to the area, so they will survive the weather. The gardens are a pleasing way to reduce excess water from your property!

Where are Rain Gardens found?

- Near streets
- Near driveways
- Near a house

Why is this useful?

- These rain gardens are extremely useful when there is a big rainstorm. The water then has a place to return back into the ground and keep the surrounding area safe for use.
